

Debugging In app.py file

- Imported Redirect and URL_for libraries.
- Changed method=["POST"] to method=["GET","POST"].
- In place to ".args.get" we gave .form.
- Added a line return redirect(url_for('index')).

Debugging In home.html file

- Added a label tag named "Enter a note : " as it used to locate where the user needs to type his notes.

Above mentioned points were changed in both the files in order to debug the code and run the web page successfully.

Before Debugging

After Debugging
